

PEDAGOGICAL METHODS PROMOTED BY JADIDS IN EDUCATIONAL ACTIVITIES

*Toshboltayeva Nodira Ibrahimjonovna,**Mamaziyayeva Charoskhan Mirzaamirovna**Teachers of the Department of psychology of the individual*

Annotation: The issue of personality perfection is studied in every possible way today. It is being researched on scientific grounds and given the necessary consultations. In the process of educational activities, the issue of cooperation is important. In teaching, methodical methods should be able to be used in their place.

Keywords: personality, perfection, family relationships, virtue, healthy lifestyle, moral maturity, skills, competence, individuality.

We are taking step-by-step steps to gain access to a qualitatively complete new society, a deeply integrated economic space, a unified communication and Information System in the new century. Living in this society requires a lot of preparation, knowledge. And in order for the step we take to be reliable and decisive, we need modern, highly qualified personnel who can work in a market economy.

In the worldview of the great thinker Beruniy, the problems of creative thinking have an advantageous status. Berunius relies on the principles of observation, Test-experience, ingenuity, in the search for solutions to these issues. Berunius' creative thinking, his achievements in the study of the nature of his time, in the interpretation of natural processes, embodied ideas that man could not think of, and in anew-new scientific predictions. According to the scientist-“ignorance – leads to imitation, far from scientific justification. It lacks the pleasure of creative exploration”.¹ as can be seen from the above analyzes, in eastern philosophical thought, creativity was considered as a concept with a complex structure.

Perfection in a person lies primarily in his understanding of freedom of thought, thinking. That is why Abdullah Avloni focuses on the discipline of thought. According to his assertion: “the education of thought is the most necessary, a sacred task that has been appreciated since many times, relied on the attention of teachers, imposed on their conscience. The thought is the reason for a person's kindness, admiration”².

In psychology, the activity, behavior and behavior of the student, focusing on the development of the social experience of a person, is carried out as a training of an active process. Typically, talim activities include the following conditions that are fraught :

A) appropriate externalization of a certain type of ideal and practical activity uschn tevarak-mastering the properties and laws of the environment.

B) the acquisition of methods and operations that help to assimilate existing data and information.

² A.AVLONIY. Turkiy guliston yohud axloq. T.: 1992. b.13

C) arming and students with methods of using informative materials intended for the selection and control of optimal style, rational guidance and operatives in accordance with the intended purpose and problem condition.

In our opinion, in higher education, it is advisable that the process of managing educational activities by a student is carried out in the early stages with the direct guidance and support of the teacher. Otherwise, the content of Higher Education, the components of educational activity, its psychological characteristics and laws, ways, means of its composition, methods of assimilation, acquisition, acquisition can become incomprehensible to students. In order to improve higher learning, it is important to train students to gain knowledge and arm themselves with active methods that meet the requirements of the present time.

Oddly enough, the process of reading also depends on the peculiarities of the reader – the individual characteristic of his psychic development (from mental, emotional, volitional humor), on the relationship in which he is determined in relation to reading, on his interests. In other words, the learning process is carried out not so much on what and the same result of the student, that is, on the basis of the individual and psychological characteristics of the student, and not the consequence of the conditions that affect the student from the surface.

The effective use of the ethnopsychological features of the Uzbek people plays an important role in the content of the human personality, which has developed in every possible way. As Abdullah Awaani put it: "discipline is for us either Khayat or Mamat; either salvation or salvation; or happiness or disaster". In the upbringing of the younger generation should take the leading place in national competence, universal, folk national values, customs, traditions (ethnopsychological and ethnopedagogical attitude of upbringing). Through these, the following qualities should be brought up in young people:

- a) formation of patriotic feelings in young people;
- b) benevolence, respect for people, compassion;
- c) Honor, Honor, Honor adults;
- g) gentleness;
- d) businessmanship, dexterity, workmanship, economic thinking;
- e) cocktails from a small age;
- j) physical strength;
- z) ahlok-decency;
- i) familiarity;
- k) respect for women;

During the training, the student will be able to independently complete the given assignments as well as be able to state. This develops the independent-creative thinking skills in students.

The use of advanced pedagogical technologies in the educational process, along with the colorful, interesting organization of classes, expands the circle of thinking, thinking of students, allows you to better master the material being taught.
